If you are a software developer, you will most likely have had to deal with licensing issues for some time now. Because of the fact that your applications are available for multiple platforms, you have to make sure they will be used only for authorized purposes, in order to ensure your profits do not fall short of expectations. There are many ways to deal with licensing, and the most common ones are the following: Certificates of authenticity, which are usually bound to the license in question A fixed cost for a user to access the application Time restrictions Encryption schemes, which can also come in the form of removable media keys All of the above are valid licensing methods, and the most convenient way of dealing with them is by using a digital certificate, which can be combined with various digital content and licensing schemes. Migrating from any of the above to a digital certificate has never been easier. There are many companies that provide these kinds of certificates, and they offer them in all shapes and forms. Why should you care? Security is an important issue, and the more it is taken into account, the better. If you want your applications to be more secure, you should look for a certificate that will be more than enough to achieve this, in the most convenient way possible. However, all of the above still don't provide the level of security you want to see. When it comes to software development, your application is your main asset, and you want to keep it safe. If you do not want your customers to exploit your software, you will need to impose specific limitations on their use, in order to be fully certain that they can't misappropriate your product and sell it on for their own profits. Some of these limitations might include the following: No attempts to simulate the legitimate use of your product No attempts to modify the default settings of the program in question No attempts to gain illegal access to information held by the software No attempts to uninstall or modify your product No attempts to recover data lost by the software Etc. In order to be truly safe, your software should be capable of performing every one of the above checks and all the time, without user intervention. For this purpose, the PC Guard service provides an extensive range of tools that can be used to achieve the stated aims, such as checks, time limits, encryption, network
